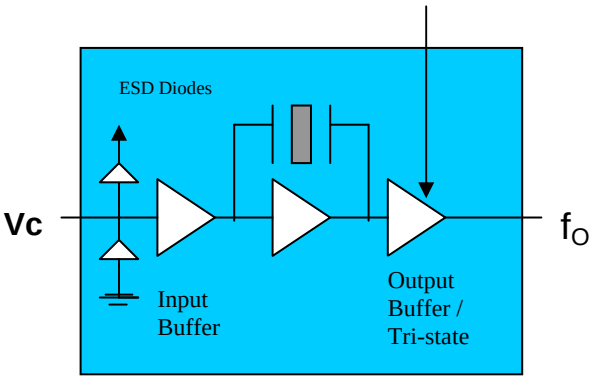
VVC1 VVC2

Voltage Controlled Crystal Oscillator

The VVC1 Voltage Controlled Crystal Oscillator

Features

- VCXO with a CMOS output
- Small 5.0 X 7.0 X 1.9 mm package
- Output frequencies to 66 MHz
- 5.0 or 3.3 V operation
- Low Jitter < 6 pS rms, f_o>12MHz
- Tri-State Output for test and board debug
- 0/70 or –40/85 °C operating temperature
- Hermetically sealed ceramic SMD package
- Lead free construction
- Product is compliant to RoHS directive and fully compatible with lead free assembly



Applications

- SONET/SDH/DWDM
- Ethernet, Gigabit Ethernet
- xDSL/PCMCIA cards
- Digital Video
- Broadband Access

Description

Vectron's VVC1/VVC2 Voltage Controlled Crystal Oscillator (VCXO) is a quartz stabilized square wave generator with a CMOS output and is tested at CMOS and TTL (5.0 volt operation) logic levels.

The VVC1/VVC2 uses fundamental crystals resulting in low jitter performance and a monolithic IC which improves reliability and reduces cost.

1. A 0.01uF and a 0.1uF capacitor should be located as close to the supply as possible (to ground) is recommended.
2. Figure 1 defines these parameters. Figure 2 illustrates the equivalent five gate TTL load and operating conditions under which these parameters are tested and specified.
3. Symmetry is defined as (ON TIME/PERIOD with Vs= 1.4 V for TTL and Vs=2.5 V for CMOS, 5 volt operation, and Vs=1.65V for 3.3 Volt operation.
4. Only available as 50 ppm APR.

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied at these or any other conditions in excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

Reliability

The VVC1/VVC2 is capable of meeting the following qualification tests.

Handling Precautions

Although ESD protection circuitry has been designed into the the VVC1/VVC2, proper precautions should be taken when handling and mounting. VI employs a Human Body Model and a Charged-Device Model (CDM) for ESD susceptibility testing and design protection evaluation. ESD thresholds are dependent on the circuit parameters used to define the model. Although no industry wide standard has been adopted for the CDM, a standard HBM of resistance = 1.5kohms and capacitance = 100pF is widely used and therefore can be used for comparison purposes.

Table 5. ESD Ratings

Model	Minimum	Conditions
Human Body Model	1500	MIL-STD-883 Method 3115
Charged Device Model	1000	JESD 22-C101

Suggested IR profile

Devices are built using lead free epoxy and can also be subjected to standard lead free IR reflow conditions.
