

## 7A SWITCHING REGULATOR

- 7A OUTPUT CURRENT
- 5.1V TO 40V OUTPUT VOLTAGE RANGE
- 0 TO 90% DUTY CYCLE RANGE
- INTERNAL FEED-FORWARD LINE REGULATION
- INTERNAL CURRENT LIMITING
- PRECISE 5.1V  $\pm$  2% ON CHIP REFERENCE
- RESET AND POWER FAIL FUNCTIONS
- SOFT START
- INPUT/OUTPUT SYNC PIN
- UNDER VOLTAGE LOCK OUT WITH HYSTERETIC TURN-ON
- PWM LATCH FOR SINGLE PULSE PER PERIOD
- VERY HIGH EFFICIENCY
- SWITCHING FREQUENCY UP TO 500KHz
- THERMAL SHUTDOWN
- CONTINUOUS MODE OPERATION

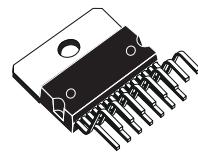

### DESCRIPTION

The L4977A is a stepdown monolithic power switching regulator delivering 7A at a voltage variable from 5.1 to 40V.

### BLOCK DIAGRAM

### MULTIPOWER BCD TECHNOLOGY

Multiwatt15V  
ORDERING NUMBER: L4977A

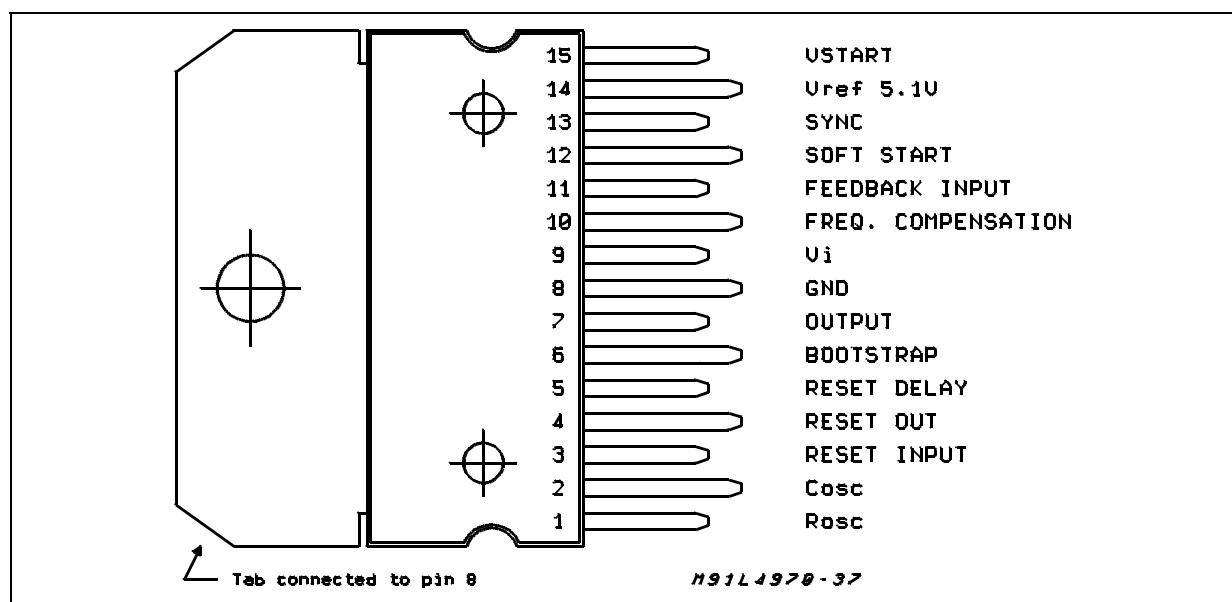

Realized with BCD mixed technology, the device uses a DMOS output transistor to obtain very high efficiency and very fast switching times. Features of the L4977A include reset and power fail for microprocessors, feed forward line regulation, soft start, limiting current and thermal protection. The device is mounted in a 15-lead multiwatt plastic power package and requires few external components. Efficient operation at switching frequencies up to 500Khz allows reduction in the size and cost of external filter components.

# L4977A

## ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_9$	Input Voltage	55	V
$V_9$	Input Operating Voltage	50	V
$V_7$	Output DC Voltage Output Peak Voltage at $t = 0.1\mu s$ $f = 200\text{KHz}$	-1 -7	V V
$I_7$	Maximum Output Current	Internally Limited	
$V_6$	Bootstrap Voltage Bootstrap Operating Voltage	65 $V_9 + 15$	V V
$V_3, V_{12}$	Input Voltage at Pins 3, 12	12	V
$V_4$	Reset Output Voltage	50	V
$I_4$	Reset Output Sink Current	50	mA
$V_5, V_{10}, V_{11}, V_{13}$	Input Voltage at Pin 5, 10, 11, 13	7	V
$I_5$	Reset Delay Sink Current	30	mA
$I_{10}$	Error Amplifier Output Sink Current	1	A
$I_{12}$	Soft Start Sink Current	30	mA
$P_{tot}$	Total Power Dissipation at $T_{case} < 120^\circ\text{C}$	30	W
$T_j, T_{stg}$	Junction and Storage Temperature	-40 to 150	°C

## PIN CONNECTION (Top view)

## THERMAL DATA

Symbol	Parameter	Value	Unit
$R_{th j-case}$	Thermal Resistance Junction-case	max	1 °C/W
$R_{th j-amb}$	Thermal Resistance Junction-ambient	max	35 °C/W

**PIN FUNCTIONS**

Nº	Name	Function
1	OSCILLATOR	$R_{osc}$ . External resistor connected to ground determines the constant charging current of $C_{osc}$ .
2	OSCILLATOR	$C_{osc}$ . External capacitor connected to ground determines (with $R_{osc}$ ) the switching frequency.
3	RESET INPUT	Input of Power Fail Circuit. The threshold is 5.1V. It may be connected via a divider to the input for power fail function. It must be connected to the pin 14 an external $30K\Omega$ resistor when power fail signal not required.
4	RESET OUT	Open Collector Reset/power Fail Signal Output. This output is high when the supply and the output voltages are safe.
5	RESET DELAY	A $C_d$ capacitor connected between this terminal and ground determines the reset signal delay time.
6	BOOTSTRAP	A $C_{boot}$ capacitor connected between this terminal and the output allows to drive properly the internal D-MOS transistor.
7	OUTPUT	Regulator Output.
8	GROUND	Common Ground Terminal
9	SUPPLY VOLTAGE	Unregulated Input Voltage.
10	FREQUENCY COMPENSATION	A series RC network connected between this terminal and ground determines the regulation loop gain characteristics.
11	FEEDBACK INPUT	The Feedback Terminal of the Regulation Loop. The output is connected directly to this terminal for 5.1V operation; It is connected via a divider for higher voltages.
12	SOFT START	Soft Start Time Constant. A capacitor is connected between thi sterminal and ground to define the soft start time constant.
13	SYNC INPUT	Multiple L4977A are synchronized by connecting pin 13 inputs together or via an external syncr. pulse.
14	$V_{ref}$	5.1V $V_{ref}$ Device Reference Voltage.
15	$V_{start}$	Internal Start-up Circuit to Drive the Power Stage.

**CIRCUIT OPERATION** (refer to the block diagram)

The L4977A is a 7A monolithic stepdown switching regulator working in continuous mode realized in the new BCD Technology. This technology allows the integration of isolated vertical DMOS power transistors plus mixed CMOS/Bipolar transistors.

The device can deliver 7A at an output voltage adjustable from 5.1V to 40V, and contains diagnostic and control functions that make it particularly suitable for microprocessor based systems.

**BLOCK DIAGRAM**

The block diagram shows the DMOS power transistor and the PWM control loop. Integrated functions include a reference voltage trimmed to  $5.1V \pm 2\%$ , soft start, undervoltage lockout, oscillator with feedforward control, pulse by pulse current limit, thermal shutdown and finally the reset and power fail circuit. The reset and power fail circuit provides an output signal for a microprocessor indicating the status of the system.

Device turn on is around 11V with a typical 1V hysteresis, this threshold provides a correct voltage for the driving stage of the DMOS gate and the hysteresis prevents instabilities.

An external bootstrap capacitor charged to 12V by an internal voltage reference is needed to provide correct gate drive to the power DMOS. The driving circuit is able to source and sink peak currents of around 0.5A to the gate of the DMOS transistor. A typical switching time of the current in the DMOS transistor is 50ns. Due to the fast commutation switching frequencies up to 500kHz are possible.

The PWM control loop consists of a sawtooth oscillator, error amplifier, comparator, latch and the output stage. An error signal is produced by comparing the output voltage with the precise  $5.1V \pm 2\%$  on chip reference. This error signal is then compared with the sawtooth oscillator, in order to generate a fixed frequency pulse width modulated drive for the output stage. A PWM latch is included to eliminate multiple pulsing within a period even in noisy environments. The gain and

## L4977A

Figure 1: Feedforward Waveform

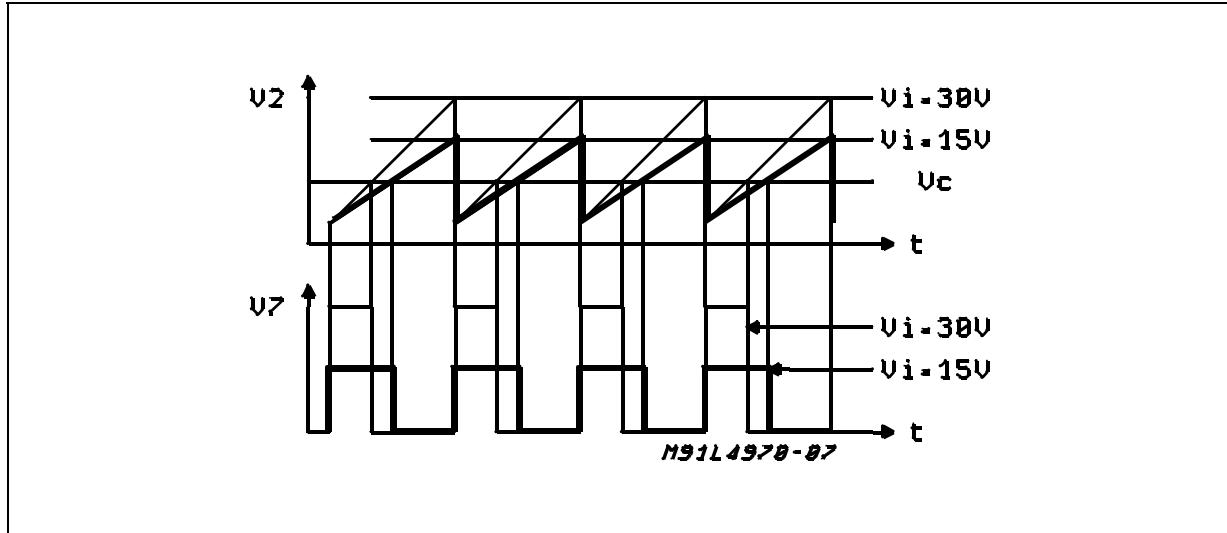

Figure 2: Soft Start Function

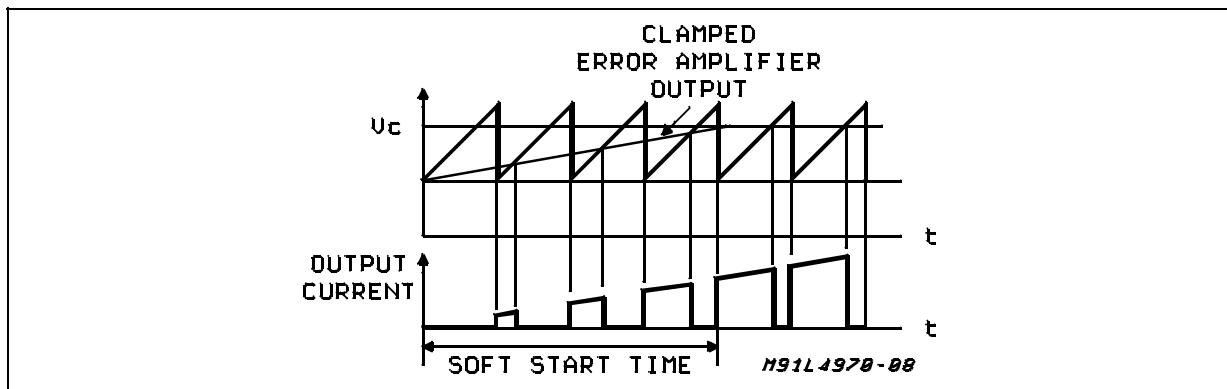

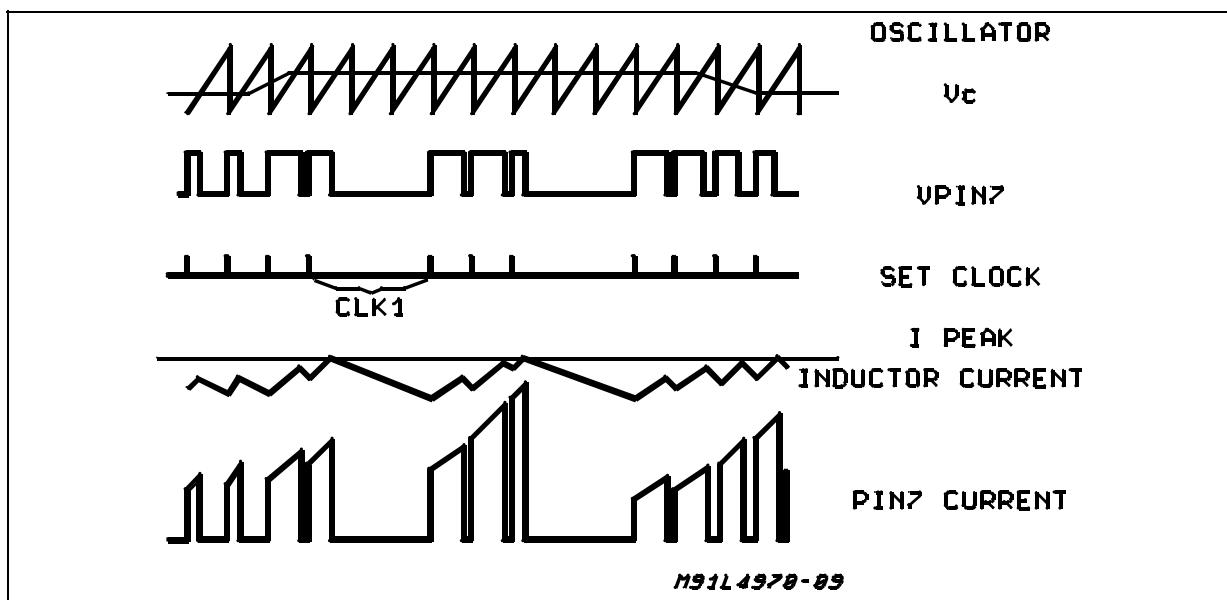

Figure 3: Limiting Current Function

stability of the loop can be adjusted by an external RC network connected to the output of the error amplifier. A voltage feedforward control has been added to the oscillator, this maintains superior line regulation over a wide input voltage range. Closing the loop directly gives an output voltage of 5.1V, higher voltages are obtained by inserting a voltage divider.

At turn on output overcurrents are prevented by the soft start function (fig. 2). The error amplifier is initially clamped by an external capacitor  $C_{ss}$  and allowed to rise linearly under the charge of an internal constant current source.

Output overload protection is provided by a current limit circuit (fig. 3). The load current is sensed by an internal metal resistor connected to a comparator. When the load current exceeds a preset threshold the output of the comparator sets a flip flop which turns off the power DMOS. The next clock pulse, from an internal 40kHz oscillator will reset the flip flop and the power DMOS will again conduct. This current protection method, ensures

a constant current output when the system is overloaded or short circuited and limits the switching frequency, in this condition, to 40kHz.

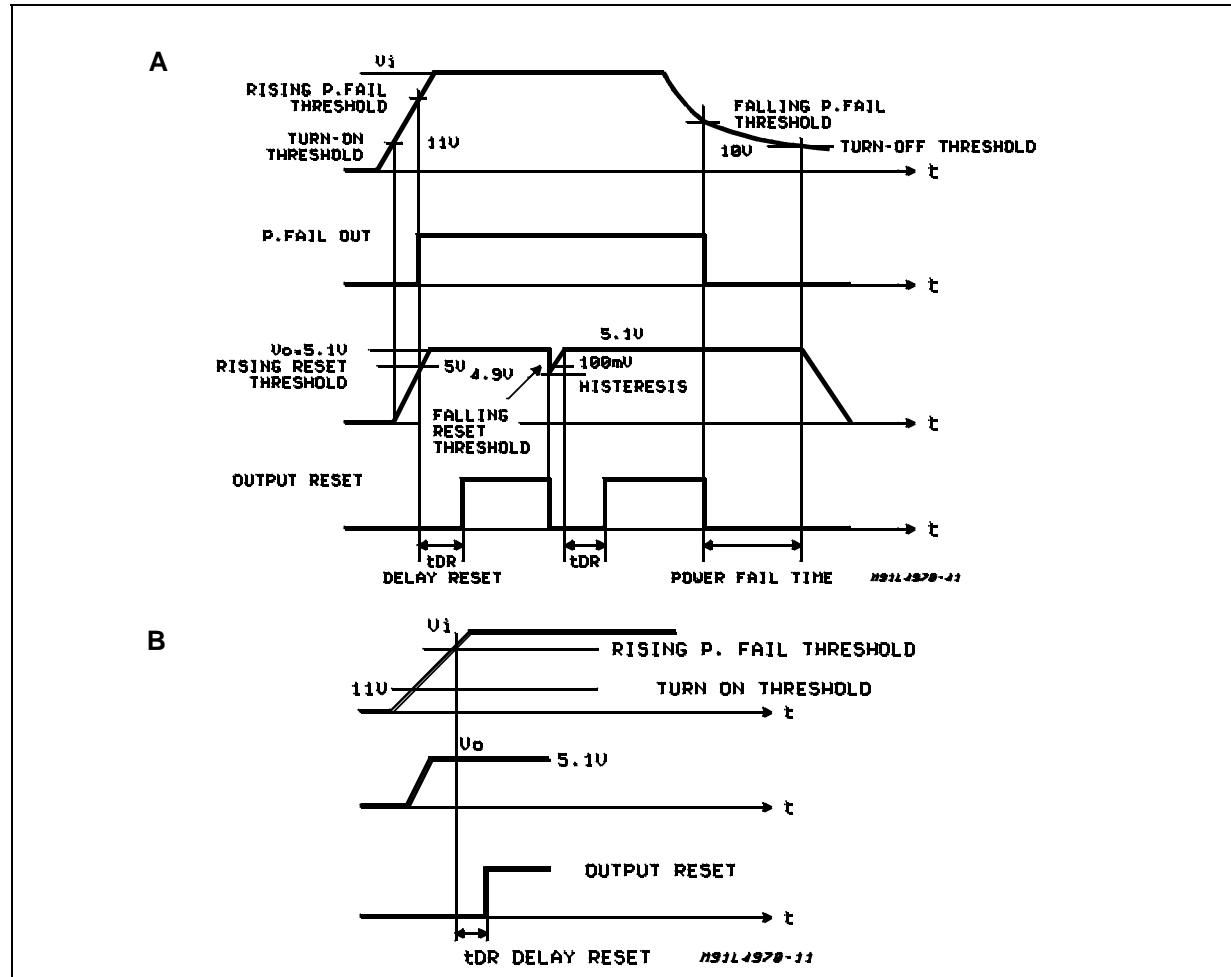

The Reset and Power fail circuitry (fig 4) generates an output signal when the supply voltage exceeds a threshold programmed by an external voltage divider. The reset signal, is generated with a delay time programmed by an external capacitor on the delay pin. When the supply voltage falls below the threshold or the output voltage goes below 5V the reset output goes low immediately. The reset output is an open collector-drain.

Fig 4A shows the case when the supply voltage is higher than the threshold, but the output voltage is not yet 5V.

Fig 4B shows the case when the output is 5.1V but the supply voltage is not yet higher than the fixed threshold.

The thermal protection disables circuit operation when the junction temperature reaches about 150°C and has an hysteresis to prevent unstable conditions.

**Figure 4:** Reset and Power Fail Functions.
